University of Seville

The European countries show significant differences in employment rates by sex, age groups and educational attainment level. The share of working men is greater than the percent of working women in all the nations, but these differences tend to diminish when you analyse individuals with higher levels of education.

The goal of our study is the identification of clusters or homogenous sets of countries according to the temporal evolution of the integration of highly education women in the labour market. The second part of the paper focuses on the detecting of policies that can have contributed to these different patterns of evolution.
